Diffusion of Successful Same Day Discharge Practice for Total Joint Arthroplasty Patients to a Select Population of Mastectomy Patients

June Nichols, BSN, RN, Clinical Leader
Charlene Salvi, BSN, RN, Clinical Leader

Background
• Reimbursement criteria by the Center for Medicare & Medicaid Services (CMS) inpatient-only list continues to evolve with advancements in technology, care and coordination.
• Hospitals face business and quality imperatives of adjusting care pathways to allow for safe, high quality discharge of surgical patients earlier than ever.

Setting
• A 171-bed community teaching hospital in the northeast United States
• Previous practice was to admit patients to the surgical unit for 24 hours prior to discharge.
• Staff wanted to model the successful same day discharge practice for total joint arthroplasty patients to a new patient population.

Purpose
To implement a novel care pathway to discharge patients undergoing same day, unilateral mastectomy without reconstruction from the post-anesthesia care unit (PACU) while maintaining high quality outcomes and patient satisfaction.

Process of Implementation
• Following the leadership decision to initiate same day PACU discharge for eligible patients undergoing a mastectomy, a PACU nurse champion was identified.
• The nurse champion identified required process changes and collaborated with members of the interdisciplinary team to develop this novel care pathway.
• Enhancements included:
  • A new standard order set developed in collaboration with the surgical Advanced Practice Provider (APP)
  • Customized aspects of the electronic health record to clarify discharge materials for the patients
  • Collaborated with the Chief of Anesthesia to develop and disseminate a post-operative pain management protocol
  • Secured a dedicated physical therapy pager and space for patient evaluation

Statement of Successful Practice
• Since June 2020, all eligible patients (n=5) have been successfully discharged using the new care pathway.
  • Mean length of stay decreased for this population to approximately 6 hours from the previous 24 hour inpatient admission
  • Feedback from patients, surgeons, APPs, and nurses for this new pathway has been very positive
  • Quality Metrics have not been impacted
  • This novel care pathway has been successfully initiated for patients undergoing same day prostatectomy since January 2021

Implications for Advancing the Practice of PeriAnesthesia Nursing
• The successful implementation of PACU discharge mastectomy patients is the result of nurses leading collaborative innovation.
• As organizations across the country explore options to decrease length of stay, PACU nurses will play an important role in addressing strategic initiatives by embracing novel care pathways.

Next steps
• Initiate a new process to decrease the overall length of stay in the PACU for this population
  • Surgeon notified when patient is ready for discharge
  • Discharge orders written after MD evaluation
• Advance this care pathway to include patients scheduled for same day bilateral mastectomy without reconstruction
